Pushpak — Delivery Items

1. Definition

Delivery Items are the linen/fabric items that a hotel has requested and that the driver is expected to deliver during a hotel visit.

A delivery item has:

- **Expected Quantity** — quantity requested by the hotel/order.
- **Delivered Quantity** — actual quantity handed over to the hotel.
- **Return Fresh** — fresh linen from the expected quantity that was not delivered.

---

2. Regular Orders

A **Regular Order** is a recurring hotel order.

Regular Orders can be:

- Daily
- Weekly
- Monthly

The exact delivery items depend on the hotel's order.

Most hotels use the same/common types of linen for their orders.

---

3. Expected Quantity

Expected Quantity is the quantity of a particular linen item that the hotel/order requires.

Example:

- Expected Quantity = 500
- The driver is expected to deliver 500 units.

The Expected Quantity is the reference quantity used to determine whether there is a delivery shortage.

---

4. Delivered Quantity

Delivered Quantity is the actual quantity of fresh linen handed over to the hotel.

Exact delivery

If:

- Expected = 500
- Delivered = 500

Then there is **no shortage** and **Return Fresh is not required**.

Short delivery

If:

- Expected = 500
- Delivered = 450

Then:

- Delivered = 450
- Return Fresh = 50

The app requires the Return Fresh quantity to be entered before proceeding.

---

5. Delivery Quantity Rules

Driver cannot over-deliver

The driver **cannot deliver more than the Expected Quantity**.

The app prevents Delivered Quantity from being greater than Expected Quantity.

Example:

- Expected = 500
- Driver has 520 available

The driver can deliver only **500**.

The extra 20 units cannot be entered as Delivered Quantity.

---

6. Return Fresh

Return Fresh represents fresh linen that was expected but was **not delivered** to the hotel.

Return Fresh is calculated as:

Return Fresh = Expected Quantity − Delivered Quantity

Example:

- Expected = 500
- Delivered = 450
- Return Fresh = 50

The driver should enter **50** as Return Fresh.

Return Fresh cannot exceed Expected Quantity

The app prevents Return Fresh from being greater than Expected Quantity.

Example:

- Expected = 500
- Return Fresh cannot be 501.

Return Fresh is required for shortages

If Delivered Quantity is less than Expected Quantity, Return Fresh must be entered.

The app blocks the driver from continuing until the required Return Fresh quantities have been entered.

This applies even when the shortage is only **1 unit**.

Example:

- Expected = 500
- Delivered = 499
- Return Fresh = 1

The driver must enter the Return Fresh quantity before continuing.

Return Fresh can be zero

Return Fresh can be **0**.

When there is no shortage:

- Expected = 500
- Delivered = 500
- Return Fresh = 0

---

7. Return Fresh by Product

Return Fresh is entered separately for each delivery item/product that has a shortage.

Example:

Item	Expected	Delivered	Return Fresh
Bedsheet	500	450	50
Pillow Cover	300	280	20

Each short product requires its own Return Fresh quantity.

---

8. Delivery Shortage Flow

When the delivered quantity is less than the expected quantity:

1. Enter the actual **Delivered Quantity**.
2. Enter **Return Fresh**.
3. Complete the remaining hotel visit information.
4. Continue to Pickup / Heavy Soil / Damaged / Remarks as applicable.
5. Save and Continue.
6. Select the applicable **Shortage Reason**.
7. Generate the Digital DC.

---

9. Return Fresh and Shortage Reason Are Different

Return Fresh records **how many fresh linen units were not delivered**.

Shortage Reason records **why the expected quantity was not delivered**.

Example:

Expected = 500
Delivered = 450
Return Fresh = 50

The driver then selects the appropriate shortage reason, such as:

- Customer Refused
- Packed Less
- Damaged in Transit
- Soiled Quantity Less
- Other

Return Fresh is therefore a **quantity**, while Shortage Reason is the **reason for the shortage**.

---

10. Hotel Refuses Part of the Delivery

If the hotel refuses part of the expected quantity:

Example:

- Expected = 500

- Hotel accepts = 450
- Return Fresh = 50
- Shortage Reason = **Customer Refused**

The driver delivers only the accepted quantity and records the remaining quantity as Return Fresh.

---

11. Fresh Linen Damaged in Transit

If fresh linen is damaged while being transported from the warehouse to the hotel:

Example:

- Expected = 500
- 20 fresh units are damaged during transit.
- Good units delivered = 480
- Return Fresh = 20
- Shortage Reason = **Damaged in Transit**

The damaged fresh linen is returned to the warehouse.

Damaged in Transit refers to fresh linen damaged during transportation.

This is different from **Damaged** recorded during Pickup, which refers to physical damage in used linen returned by the hotel.

---

12. Warehouse Packed More Than Expected

If the warehouse has packed more than the expected quantity, the driver can still deliver only the Expected Quantity.

Example:

- Expected = 500
- Warehouse packed = 520
- Driver can deliver = 500

The driver cannot enter 520 as Delivered Quantity.

---

13. Return Fresh Editing Rules

Before Save and Continue

Return Fresh can be edited before **Save and Continue**.

After DC Generation but Before OTP

Return Fresh can be changed after the Digital DC has been generated, as long as the DC has **not yet been OTP authenticated**.

If the quantity is changed:

- Update the quantity.
- Regenerate the DC.
- Complete the new authentication flow.

After OTP Authentication

Return Fresh **cannot be changed after OTP authentication**.

The OTP-authenticated DC is final.

---

14. App Validation Rules

The app enforces the delivery quantity rules.

The app prevents:

- Delivered Quantity > Expected Quantity
- Return Fresh > Expected Quantity

The app also blocks progression when a required Return Fresh quantity has not been entered.

---

15. Important Examples

Example 1 — Exact delivery

Expected = 500
Delivered = 500
Return Fresh = 0

Result: No shortage.

Example 2 — One-unit shortage

Expected = 500
Delivered = 499
Return Fresh = 1

Result: Return Fresh must be entered.

Example 3 — Customer refuses quantity

Expected = 500
Delivered = 450
Return Fresh = 50
Shortage Reason = Customer Refused

Example 4 — Transit damage

Expected = 500
Delivered = 480
Return Fresh = 20
Shortage Reason = Damaged in Transit

Damaged fresh linen is returned to the warehouse.

Example 5 — Warehouse has extra stock

Expected = 500
Warehouse packed = 520
Delivered = 500

The driver cannot deliver more than 500.

---

16. FAQ

Q: Can the driver deliver more than the Expected Quantity?
No. The app prevents Delivered Quantity from exceeding Expected Quantity.

Q: What is Return Fresh?
Return Fresh is the quantity of expected fresh linen that was not delivered.

Q: How is Return Fresh calculated?
Return Fresh = Expected Quantity − Delivered Quantity.

Q: Can Return Fresh be greater than Expected Quantity?
No. The app prevents this.

Q: Is Return Fresh required for every shortage?
Yes. Even a 1-unit shortage requires Return Fresh to be entered.

Q: Can Return Fresh be 0?
Yes.

Q: Can Return Fresh be edited before Save and Continue?
Yes.

Q: Can Return Fresh be changed after DC generation?
Yes, if the DC has not yet been OTP authenticated. The DC must be regenerated.

Q: Can Return Fresh be changed after OTP authentication?
No.

Q: What happens if the hotel refuses part of the delivery?
Deliver the accepted quantity, enter the refused quantity as Return Fresh, and select **Customer Refused** as the shortage reason.

Q: What happens when fresh linen is damaged during transportation?
Deliver the good quantity, enter the damaged quantity as Return Fresh, select **Damaged in Transit**, and return the damaged fresh linen to the warehouse.

17. Open Questions

Delivery Item Types

- Complete list of delivery linen types: **Mostly the same/common types; exact list to be provided.**

Return Fresh Scope

- Is Return Fresh used only for delivery and not Pickup? _____

Warehouse Shortage

- What should the driver do if a shortage is discovered at the warehouse before leaving? _____

Delivery Shortage Discovered During Delivery

- Confirmed handling: driver enters the actual Delivered Quantity and corresponding Return Fresh quantity. _____ *(Detailed operational rule can be filled if needed.)*

Mixed Shortage Scenario

Scenario:

- Warehouse packed 480
- Hotel only wants 450
- Expected quantity = 500

Confirmed shortage reason: **Other**

Exact quantity-handling workflow: _____
